

CU Events App

By Mahmoud Aljarrash

CU events app is an ionic app, as the name suggests, used by anyone interested in discovering what's happening on CU Boulder campus. The app users can browse the upcoming events and checking the details of a specific event like its description, date and location and quickly make plans by adding an event to their calendar. Also, the users can search for an event by its title and they can sign up to add events to the list of events.

Firebase database will be used to store the events data and also to authenticate the users. Ideally the app should get the data from an API based on the data on this site: <https://www.colorado.edu/events/>.
